

able to figure out what to change in your project, or in your deployment process, to make your next push successful.

Follow Onscreen Suggestions

Sometimes, the platform you're pushing to will generate a message that has a clear suggestion for how to address the issue. For example, here's the message you'll see if you create a Platform.sh project before initializing a Git repository, and then try to push the project:

```
$ platform push
```

- ❶ Enter a number to choose a project:

```
[0] ll_project (votohz445ljyg)
> 0
```

- ❷ [RootNotFoundException]

Project root not found. This can only be run from inside a project directory.

- ❸ To set the project for this Git repository, run:

```
platform project:set-remote [id]
```

We're trying to push a project, but the local project hasn't been associated with a remote project yet. So, the Platform.sh CLI asks which remote project we want to push to ❶. We enter 0, to select the only project listed. But next, we see a `RootNotFoundException` ❷. This happens because Platform.sh looks for a `.git` directory when it inspects the local project, to figure out how to connect the local project with the remote project. In this case, since there was no `.git` directory when the remote project was created, that connection was never established. The CLI suggests a fix ❸; it's telling us that we can specify the remote project that should be associated with this local project, using the `project:set-remote` command.

Let's try this suggestion:

```
$ platform project:set-remote votohz445ljyg
```

```
Setting the remote project for this repository to: ll_project (votohz445ljyg)
```

```
The remote project for this repository is
now set to: ll_project (votohz445ljyg)
```

In the previous output, the CLI showed the ID of this remote project, `votohz445ljyg`. So we run the command that's suggested, using this ID, and the CLI is able to make the connection between the local project and the remote project.

Now let's try to push the project again:

```
$ platform push
```

```
Are you sure you want to push to the main (production) branch? [Y/n] y
```

```
Pushing HEAD to the existing environment main
```

```
--snip--
```

This was a successful push; following the onscreen suggestion worked.
