

Making these small tweaks allows flavourful cooking without compromising health.

Why this matters for fitness and health

For those aiming to maintain a leaner body composition, reducing oil intake can be a game-changer. Optimising power-to-weight ratio directly affects speed, endurance, and strength. Excess oil consumption leads to fat accumulation, disrupts insulin sensitivity, and makes blood sugar regulation harder — an alarming issue as diabetes cases rise among younger Indians.

The right oils matter more than quantity

Many believe “more oil = better taste,” but shifting to cold-pressed, nutrient-dense oils makes a difference:

- ✦ Extra virgin olive oil: Rich in antioxidants and heart-healthy fats.
- ✦ Mustard oil: Traditionally used in Indian cooking, rich in Omega-3s.
- ✦ Coconut oil: Stable at high heat and beneficial for metabolism.

Additionally, incorporating whole food sources of healthy fats — such as nuts, seeds, and avocados — enhances

nutrition without excessive oil use.

Tracking fat consumption: A smarter approach

Most people underestimate their oil intake. That is why I developed the Ryan Fernando App, a smart nutrition tool that helps users track fat consumption, personalise meal plans, and make healthier food choices. Often, just small portion adjustments lead to major health benefits.

By providing real-time tracking and personalised guidance, this app makes reducing excess oil intake easier and more effective.

A nation's health begins at home

The PM's call to cut oil by 10 per cent is not just about reducing obesity or preventing heart disease — it is about reshaping how India eats. If every household makes this small change, the impact on public health, sports performance, and even healthcare costs will be substantial.

A healthier population means:

- ✦ A more productive workforce with better energy levels.
- ✦ Lower healthcare costs associated with lifestyle diseases.
- ✦ Athletes with greater stamina,

faster recovery, and improved performance.

At the heart of this discussion is the belief that food is fuel. Whether you are an athlete, trying to lose weight, or simply looking to stay healthy, small, consistent improvements — like reducing oil slightly — can transform long-term health outcomes.

Are we ready to take the first step?

The question is not “Can we do this?” but rather, “Are we willing to start?”

Just like in sports, discipline and consistency bring results. This is not about a one-time resolution but a lifelong commitment to healthier choices. By making a conscious effort to reduce oil intake by 10 per cent, we move towards a healthier, stronger India — one meal at a time.
