Real-time Visual Feedback

Digital mirror enhances conventional *visual bio feedback of a mirror with additional real time limb position*, joint angles and trunk stability providing immersive training environment.

The objective evaluation of movement is the basis of the conditioning and rehabilitation of the athlete, an indispensable element for the return to activity of the athlete following an injury or surgery. *The Real time visual-feedback on the quality of the movement* guarantees the athlete to return to sport with awareness of the gesture and of his own strengths and weaknesses.

Video Analysis has been proven to improve performance. Newer technology with visual feedback during movement helps real time correction in motor learning.

The objective assessment of post-injury or post-surgery movement ensures that you obtain a picture of the weak points situation to work on during the rehabilitation process. The possibility of checking progress at any time with intermediate steps guarantees a fast and functional return to performance for the athlete.

Furthermore, the scientific approach through the allows you to concentrate together with the athlete on injury prevention, setting specific work for each individual sporting discipline. Through the qualitative evaluation of movement you access the future of training for sports disciplines. In fact, knowing in real time how the athlete performs targeted exercises and obtaining detailed reports allows you to take care of every detail of your athletes' performance.

Hitech devices has specific test programs and exercise libraries for enhancing performance in football, badminton , running, basketball, tennis and many other sports.
