

The range() function generates a series of numbers. Giving range() one argument returns a series of numbers from 0 up to, not including, the number:

```
>>> nums = list(range(5))
>>> nums
[0, 1, 2, 3, 4]
```

Pass two values to create a range that starts with the first value and ends at one less than the second value:

```
>>> high_nums = list(range(95, 100))
>>> high_nums
[95, 96, 97, 98, 99]
```

Use a third argument to specify a distance to skip between numbers in a list:

```
>>> odds = list(range(1, 10, 2))
>>> odds
[1, 3, 5, 7, 9]
```

To define a pattern, make an empty list and then modify each number in a range. This lists the powers of 10:

```
nums = []
for exp in range(5):
    nums.append(10**exp)
print(nums)
```

```
[1, 10, 100, 1000, 10000]
```
