

If a dictionary contains a variety of information about an object, it can be helpful to store a collection of dictionaries in a list:

```
musicians = []

e_fitzgerald = {
    'first': 'Ella'
    --snip--
}
musicians.append(ella)

j_joplin = {
    'first': 'Janis',
    --snip--
}
musicians.append(janis)
--snip--
```

To work with this kind of data, loop through the list, working with each dictionary in turn:

```
for musician in musicians:
    full_name = f"{musician['first']} "
    full_name += f"{musician['last']}"
    print(full_name)
```

Ella Fitzgerald

Janis Joplin
