

Setting a parameter's *default value* allows the function call to use the default value unless another value is specified with the call.

This function serves a cup of coffee. You can specify the cup size, but if you don't, you'll get a 12 oz cup:

```
def coffee(size=12):  
    """Serve a cup of coffee."""  
    print(f"Here's your {size} oz coffee!")  
  
coffee()  
coffee(16)
```

Here we get a 12 oz cup and a 16 oz cup:

```
Here's your 12 oz coffee!  
Here's your 16 oz coffee!
```

Default values are helpful because they make some arguments optional.
