

The `remove()` method removes a specific item from a list:

```
>>> airports = ['ANC', 'JNU', 'SEA', 'SIT']
>>> airports.remove('SEA')
>>> airports
['ANC', 'JNU', 'SIT']
```

If an item appears more than once in the list, only its first appearance is removed.

The `del` keyword deletes an item at a specific position in the list using its index:

```
>>> airports = ['ANC', 'JNU', 'SEA', 'SIT']
>>> del airports[2]
>>> airports
['ANC', 'JNU', 'SIT']
```

The `pop()` method removes and returns the last item in a list. The `pop()` method can also accept an index and will remove and return the item at that index:

```
>>> airports = ['ANC', 'JNU', 'SEA', 'SIT']
>>> airport = airports.pop()
>>> airport
'SIT'
>>> airport = airports.pop(0)
>>> airport
'ANC'
```
