

**A *slice* is part of a list that begins with the item at the first index specified and stops with the item before the last index specified:**

```
>>> states = ['CA', 'CO', 'CT', 'DE', 'FL', 'GA']  
>>> states[2:4]  
['CT', 'DE']
```

Omit the first index, and the slice starts with the first item in the list:

```
>>> states[:2]  
['CA', 'CO']
```

Omit the second index, and the slice goes to the end of the list:

```
>>> states[3:]  
['DE', 'FL', 'GA']
```

You can construct a slice that returns any part of a list:

|                 |                          |
|-----------------|--------------------------|
| First two items | <code>states[:2]</code>  |
| Last two items  | <code>states[-2:]</code> |
| Range of items  | <code>states[2:4]</code> |
