

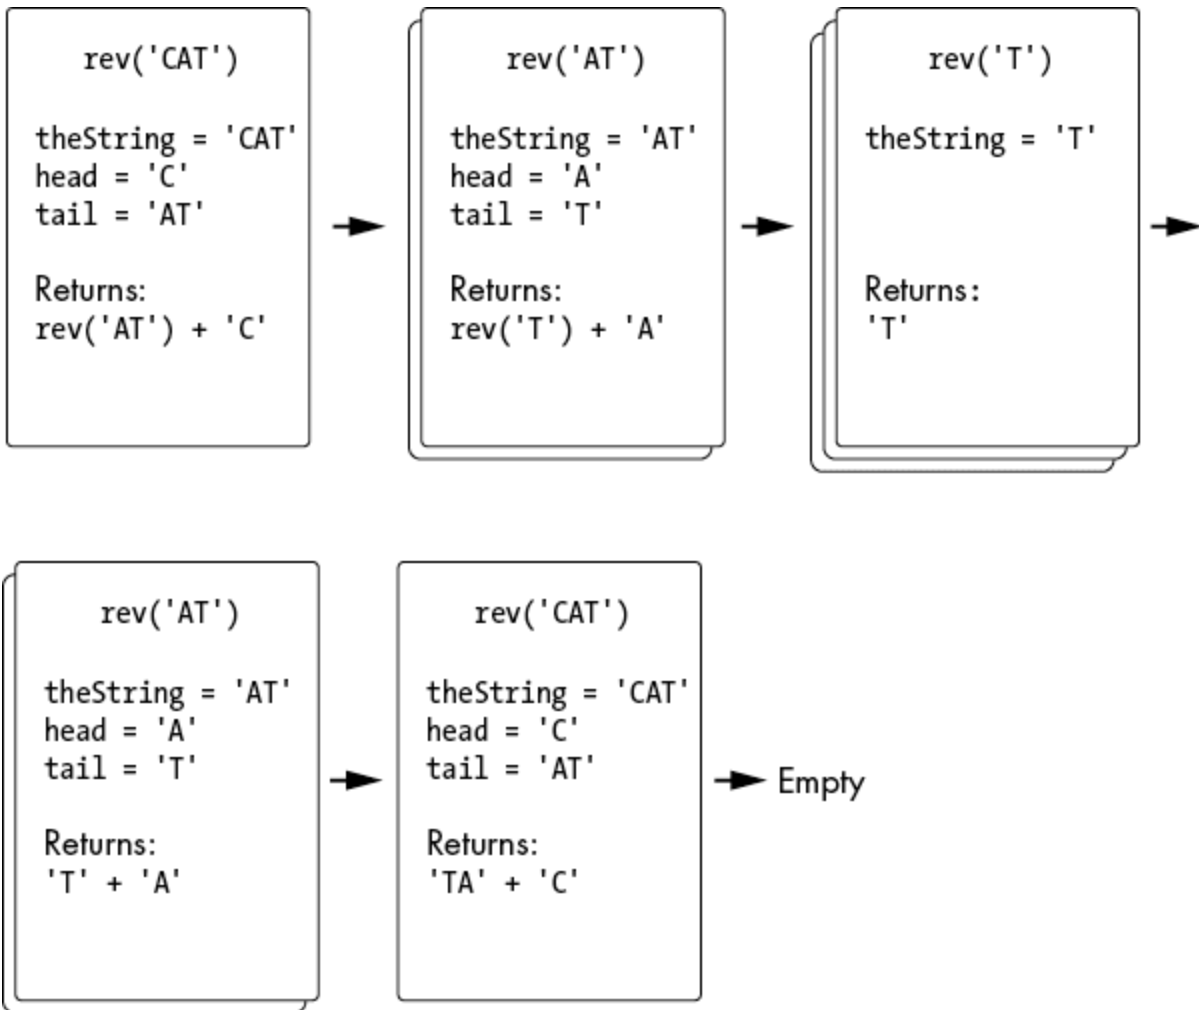

Figure 3-3: The state of the call stack as the `rev()` function reverses the `CAT` string

Here is *reverseString.py*, a Python program to reverse a string:

Python

```
def rev(theString):  
    ❶ if len(theString) == 0 or len(theString) == 1:  
        # BASE CASE  
        return theString  
    else:  
        # RECURSIVE CASE  
        ❷ head = theString[0]  
        ❸ tail = theString[1:]  
        ❹ return rev(tail) + head  
  
print(rev('abcdef'))
```
