

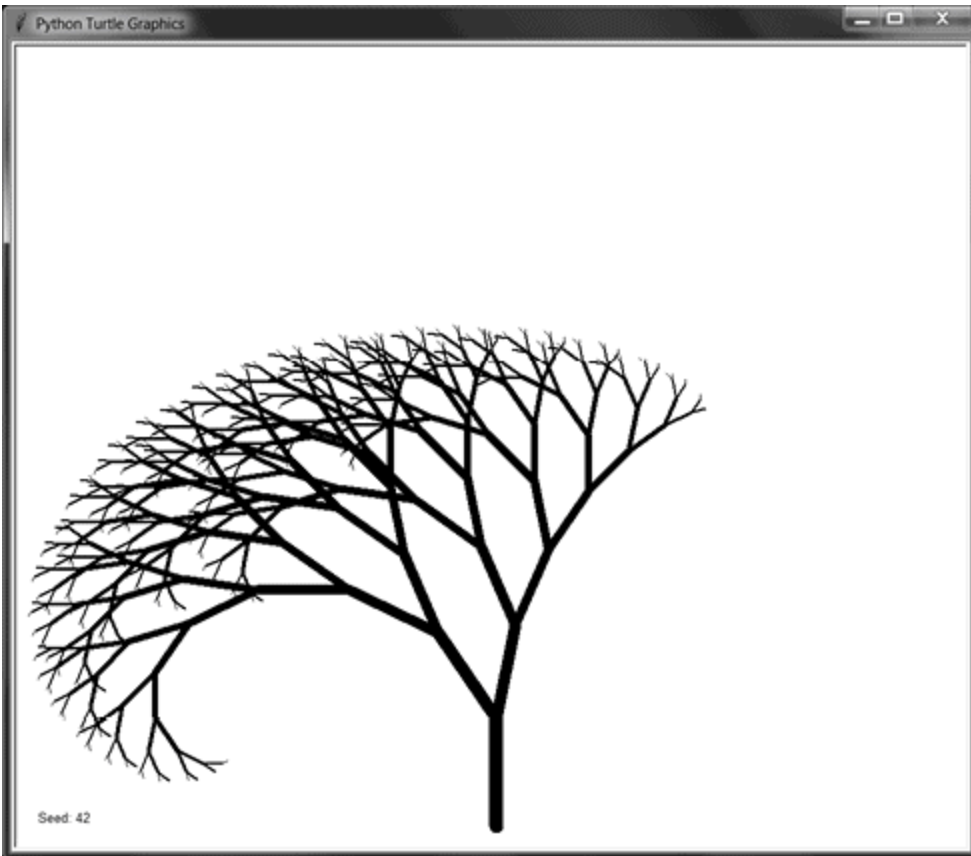

*Figure 9-11: A perfectly self-similar fractal tree generated with the left and right branches using consistent angles and lengths*

Movies and video games can use such recursive algorithms in *procedural generation*, the automatic (rather than manual) creation of 3D models such as trees, ferns, flowers, and other plants. Using algorithms, computers can quickly create entire forests consisting of millions of unique trees, saving an army of human 3D artists the painstaking effort.
