

Summary

The Fractal Art Maker projects demonstrate the endless possibilities of recursion. A simple recursive `drawFractal()` function, paired with a shape-drawing function, can create a large variety of detailed geometric art.

At the core of Fractal Art Maker is the recursive `drawFractal()` function, which accepts another function as an argument. This second function draws a basic shape repeatedly by using the size, position, and heading given in the list of specification dictionaries.

You can test an unlimited number of shape-drawing functions and specification settings. Let your creativity drive your fractal projects as you experiment with the code in this program.
