

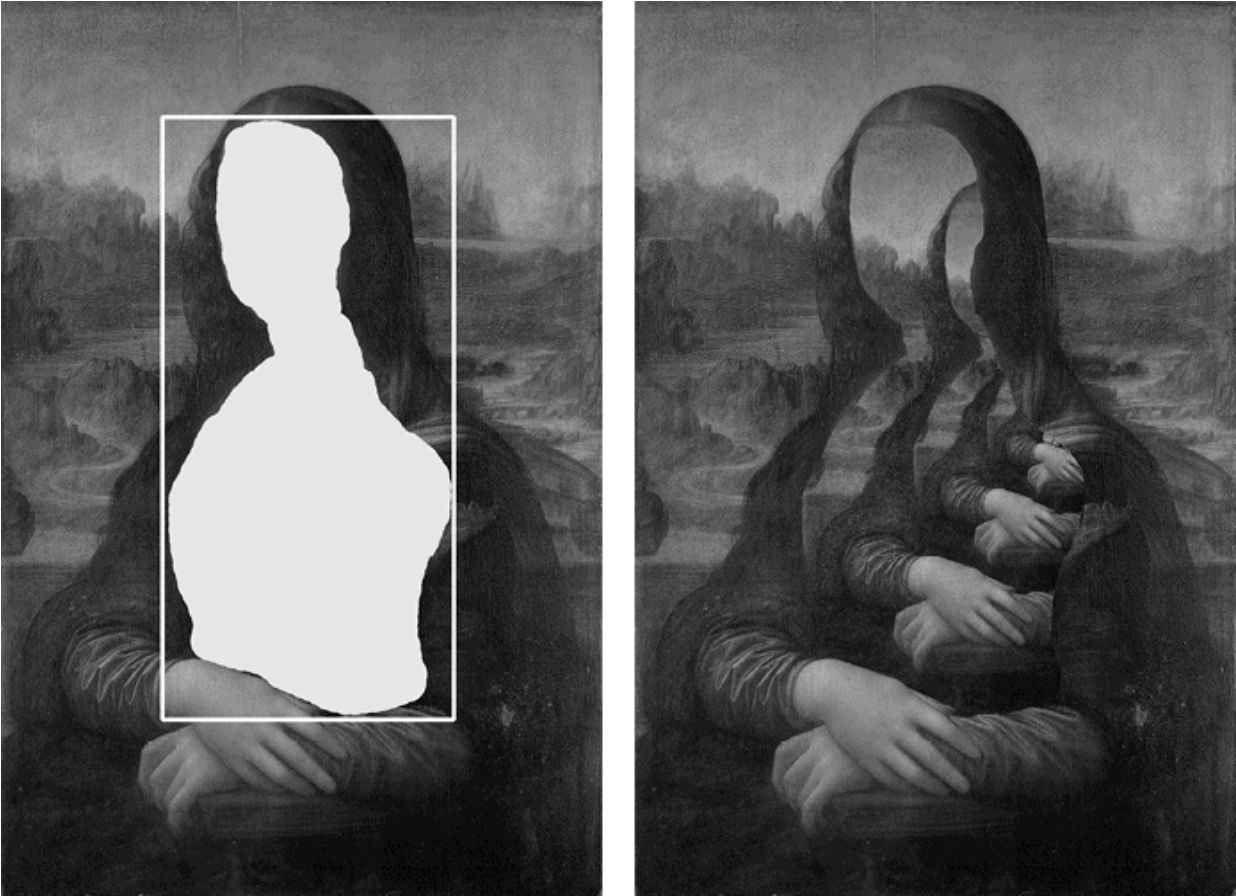

Figure 14-3: The base image with a magenta area outlined in white (left) and the recursive image it produces (right)

To calculate the resizing and placement of the resized image, the program retrieves the width and height of the base image from the `size` attribute of the `Pillow Image` object in `baseImage`. The following lines initialize four variables for the four edges of the magenta area—`magentaLeft`, `magentaRight`, `magentaTop`, and `magentaBottom`—to the `None` value:

Python

```
# Find the dimensions of the base image and its magenta area:
baseImageWidth, baseImageHeight = baseImage.size
magentaLeft = None
magentaRight = None
magentaTop = None
magentaBottom = None
```
