

You can plot the itinerary we got as the final result of simulated annealing by running `plotitinerary(cities,simanitinerary,'Traveling Salesman Itinerary - Simulated Annealing','figure5')`. You'll see the plot in [Figure 6-5](#).

[Figure 6-5](#): The final result of simulated annealing

On one hand, it's just a plot of randomly generated points with lines connecting them. On the other, it's the result of an optimization process that we performed over hundreds of thousands of iterations, relentlessly pursuing perfection among nearly infinite possibilities, and in that way it is beautiful.

Summary

In this chapter, we discussed the traveling salesman problem as a case study in advanced optimization. We discussed a few approaches to the problem,
