

Euclid's algorithm, [20–22](#)
feedback shift register, [98](#)
Galilean model, [3](#)
implementing RPM (Russian peasant multiplication), [18–20](#)
Kurushima's algorithm, [24](#)
`left` and `right` variables, [66](#)
list indexing syntax, [68](#)
math library, [73–74](#)
ordered pairs in, [152](#)
overlapping sums test, [95–96](#)
`pandas` module, [19](#)
`random` module, [58–59](#)
`random.choice()` function, [28](#)
rules for Kurushima's algorithm, [27–28](#), [30–31](#)
square roots in, [90–91](#)
`timeit` module, [57](#)
using tuples with words and spaces, [152](#)

Q

quotient, getting by dividing integers, [84](#)

R

radicals and fractions, [88](#)
radius, returning for triangle, [132–133](#)
Ramanujan, Srinivasa, [88](#)
random forests, [182–183](#). *See also* decision trees; game trees
`random` model, Python, [58–59](#)
