

**Table 2-2:** *Halving/Doubling Table, Part 2*

| Halving | Doubling |
|---------|----------|
| 89      | 18       |
| 44      |          |

We continue dividing by 2 until we reach 1, dropping the remainder every time and writing the result in the next row. As we continue, we find that 44 divided by 2 is 22, then half of that is 11, then half of that (dropping the remainder) is 5, then 2, then 1. After writing these in the halving column, we have [Table 2-3](#).

**Table 2-3:** *Halving/Doubling Table, Part 3*

| Halving | Doubling |
|---------|----------|
| 89      | 18       |
| 44      |          |
| 22      |          |
| 11      |          |
| 5       |          |
| 2       |          |
| 1       |          |

We've completed the halving column. As the name suggests, each entry in the doubling column will be double the previous entry. So since  $18 \times 2$  is 36, 36 is the second entry in the doubling column ([Table 2-4](#)).

**Table 2-4:** *Halving/Doubling Table, Part 4*

| Halving | Doubling |
|---------|----------|
| 89      | 18       |
| 44      | 36       |
| 22      |          |
| 11      |          |
| 5       |          |
| 2       |          |
| 1       |          |
