

```

entry_i = center_i
entry_j = center_j

square = fillsquare(square, entry_i, entry_j, (n**2)/2 - 4)

entry_i = math.floor(n/2) + 1
entry_j = math.floor(n/2)

square = fillsquare(square, entry_i, entry_j, 0)

square = [[n**2 if x == 0 else x for x in row] for row in square]

```

Our 11×11 square looks as follows:

```

>>> printsquare(square)

```

	[0]	[1]	[2]	[3]	[4]	[5]	[6]	[7]	[8]	[9]	[10]
[0]	56	117	46	107	36	97	26	87	16	77	6
[1]	7	57	118	47	108	37	98	27	88	17	67
[2]	68	8	58	119	48	109	38	99	28	78	18
[3]	19	69	9	59	120	49	110	39	89	29	79
[4]	80	20	70	10	60	121	50	100	40	90	30
[5]	31	81	21	71	11	61	111	51	101	41	91
[6]	92	32	82	22	72	1	62	112	52	102	42
[7]	43	93	33	83	12	73	2	63	113	53	103
[8]	104	44	94	23	84	13	74	3	64	114	54
[9]	55	105	34	95	24	85	14	75	4	65	115
[10]	116	45	106	35	96	25	86	15	76	5	66

We can verify, either manually or with our `verifysquare()` function, that this is indeed a magic square. You can do the same with any odd n and marvel at the results.

Magic squares don't have much practical significance, but it's fun to observe their patterns anyway. If you're interested, you might spend some time thinking about the following questions:

- Do the larger magic squares we created follow the odd/even alternating pattern seen in the outer edge of the Luo Shu square? Do you think every possible magic square follows this pattern? What reason, if any, would there be for this pattern?
- Do you see any other patterns in the magic squares we've created that haven't been mentioned yet?
