

[Figure 5-3](#) shows a black pixel at position (3, 5). That is an x-value of 3 (note that this is actually the fourth column, since coordinates start at 0) and a y value of 5 (actually the sixth row). Each pixel in a window is commonly referred to as a *point*. To reference a point in a window, you would typically use a Python tuple. For example, you might have an assignment statement like this, with the x value first:

---

```
pixelLocation = (3, 5)
```

---
