

*Figure 5-3: A single point (a single pixel) in a computer window*

To show an image in a window, we need to specify the coordinates of its starting point—always the upper-left corner of the image—as an (x, y) pair, as in [Figure 5-4](#), where we draw the image at location (3, 5).

When working with an image, you'll often need to deal with the *bounding rectangle*, which is the smallest rectangle that can be made that completely surrounds all pixels of the image. A rectangle is represented in pygame by a set of four values: x, y, width, height. The rectangle for the image in [Figure 5-4](#) has values of 3, 5, 11, 7. I'll show you how to use a
