

```

# 3 - Initialize the world
pygame.init()
window = pygame.display.set_mode((WINDOW_WIDTH, WINDOW_HEIGHT))
clock = pygame.time.Clock()

# 4 - Load assets: image(s), sound(s), etc.

# 5 - Initialize variables

# 6 - Loop forever
while True:

    # 7 - Check for and handle events
    for event in pygame.event.get():
        # Clicked the close button? Quit pygame and end the program
        if event.type == pygame.QUIT:
            pygame.quit()
            sys.exit()

    # 8 - Do any "per frame" actions

    # 9 - Clear the window
    window.fill(BLACK)

    # 10 - Draw all window elements

    # 11 - Update the window
    pygame.display.update()

    # 12 - Slow things down a bit
    clock.tick(FRAMES_PER_SECOND)

```

Listing 5-1: A template for creating pygame programs

Let's walk through the different parts of this template:

1. Import packages.

The template starts with the `import` statements. We first import the `pygame` package itself, then some constants defined inside `pygame` that we'll use later. The last import is the `sys` package, which we'll use to quit our program.

2. Define constants.
