

Figure 7-4: The window of a program that demonstrates objects instantiated from a variety of pygwidgets classes

The Importance of a Consistent API

One final note about building an API for a set of classes: whenever possible, it's a very good idea to build consistency into the parameters of methods in different, but similar, classes. As a good example, the first two parameters to the `__init__()` method of every class in `pygwidgets` are `window` and `loc`, in that order. If these had been in a different order in some calls, using the package as a whole would be much more difficult.
