

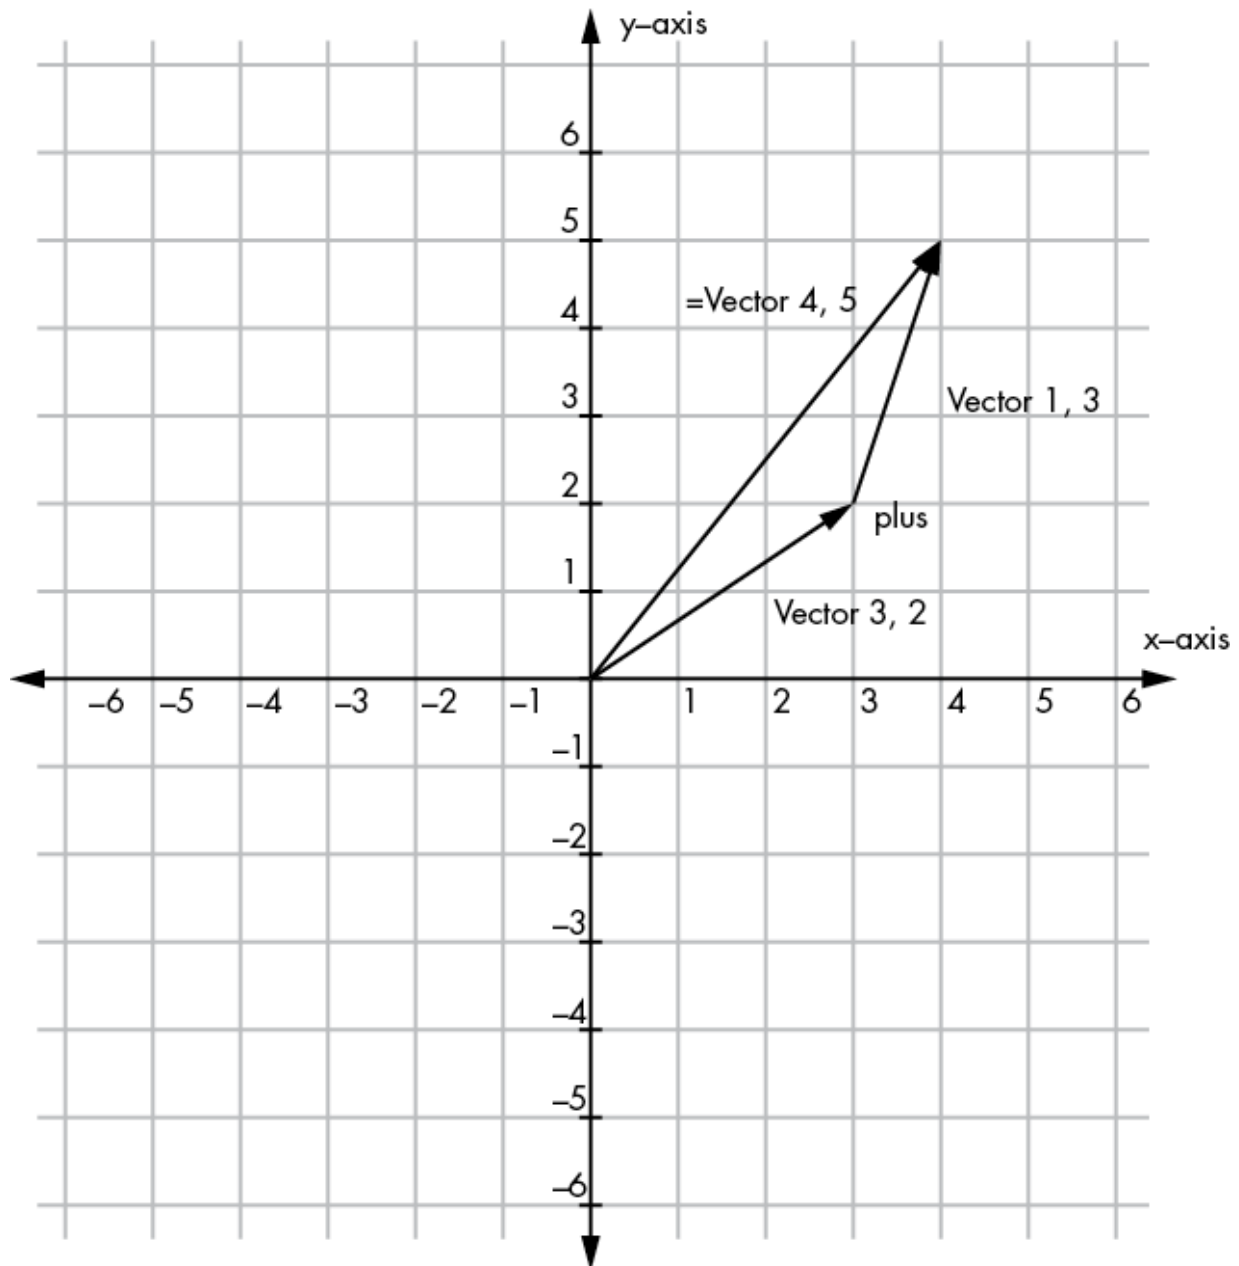

*Figure 9-2: Vector addition in Cartesian coordinates*

Adding two vectors results in a new vector whose x value is the sum of the x values of the two added vectors and whose y value is the sum of the y values of the two added vectors. In [Figure 9-2](#), we add the vector (3, 2) and the vector (1, 3) to create a vector (4, 5).

Two vectors are considered equal if their x values are the same and their y values are the same. A vector's size is computed to be the hypotenuse of
