

**autoStart**

`True` if you want the animation to start right away; defaults to `False`.

**loop**

`True` if you want to animation to loop continuously; defaults to `False`.

**showFirstImageAtEnd**

When an animation ends, show the first image again; defaults to `True`.

**nickname**

An internal name to assign to this animation, used as an argument when a `callback` is specified.

**callback**

The function or object method to call when the animation is done.

**nIterations**

The number of times to loop through the animation; defaults to 1.

Here is a typical statement to create a `SpriteSheetAnimation` object:

---

```
oEffectAnimation = pygwidgets.SpriteSheetAnimation(window, (400, 150),  
                                                    'images/effect.png', 35, 192, 192, .1,  
                                                    autoStart=True, loop=True)
```

---

This creates a `SpriteSheetAnimation` object using a single image file found at the given path. The original image contains 35 subimages. Each smaller image is 192×192 pixels, and each subimage will be shown for one-tenth of a second. The animation will start automatically and loop continuously.
