

You can make a class available in two ways: you can place the code of the class in the same file with the main program, or you can put the code of the class in an external file and use an `import` statement to bring in the contents of the file. I'll show the first approach in this chapter and the second approach in Chapter 4. The only rule is that the class definition must precede any code that instantiates an object from the class.

Calling Methods of an Object

After creating an object from a class, to call a method of the object, you use the generic syntax:

```
<object>.<methodName>(<any arguments>)
```

[Listing 2-3](#) contains the `LightSwitch` class, code to instantiate an object from the class, and code to turn that `LightSwitch` object on and off by calling its `turnOn()` and `turnOff()` methods.

File: OO_LightSwitch_with_Test_Code.py

```
# OO_LightSwitch

class LightSwitch():
    def __init__(self):
        self.switchIsOn = False

    def turnOn(self):
        # turn the switch on
        self.switchIsOn = True

    def turnOff(self):
        # turn the switch off
        self.switchIsOn = False

    def show(self): # added for testing
        print(self.switchIsOn)

# Main code
oLightSwitch = LightSwitch() # create a LightSwitch object

# Calls to methods
```
