

changes you make to the data of one object will not affect the data of another object. You can call any of the methods in the class with either object.

The example in [Listing 2-4](#) creates two light switch objects and calls methods on the different objects.

File: OO_LightSwitch_Two_Instances.py

```
# OO_LightSwitch

class LightSwitch():
    --- snipped code of LightSwitch class, as in Listing 2-3 ---

# Main code
oLightSwitch1 = LightSwitch() # create a LightSwitch object
oLightSwitch2 = LightSwitch() # create another LightSwitch object

# Test code
oLightSwitch1.show()
oLightSwitch2.show()
oLightSwitch1.turnOn() # Turn switch 1 on
# Switch 2 should be off at start, but this makes it clearer
oLightSwitch2.turnOff()
oLightSwitch1.show()
oLightSwitch2.show()
```

Listing 2-4: Create two instances of a class and call methods of each

Here's the output when this program is run:

```
False
False
True
False
```

The code tells `oLightSwitch1` to turn itself on and tells `oLightSwitch2` to turn itself off. Notice that the code in the class has no global variables. Each `LightSwitch` object gets its own set of any instance variables (just one in this case) defined in the class.
