

And here are the behaviors a `DimmerSwitch` object can perform:

- Turn on
- Turn off
- Raise level
- Lower level
- Show (for debugging)

The `DimmerSwitch` class uses the standard template shown earlier in [Listing 2-2](#): it starts with a `class` statement and a first method named `__init__()`, then defines a number of additional methods, one for each of the behaviors listed. The full code for this class is presented in [Listing 2-5](#).

File: `DimmerSwitch.py`

```
# DimmerSwitch class

class DimmerSwitch():
    def __init__(self):
        self.switchIsOn = False
        self.brightness = 0

    def turnOn(self):
        self.switchIsOn = True

    def turnOff(self):
        self.switchIsOn = False

    def raiseLevel(self):
        if self.brightness < 10:
            self.brightness = self.brightness + 1

    def lowerLevel(self):
        if self.brightness > 0:
            self.brightness = self.brightness - 1

    # Extra method for debugging
    def show(self):
```
