

Multiple Instances

Every method is written with `self` as the first parameter, so the `self` variable receives the object used in each call. This has a major implication: it allows any method within a class to work with *different* objects. I'll explain how this works using an example.

In [Listing 2-9](#), we'll create two `TV` objects and save them in two variables, `oTV1` and `oTV2`. Each `TV` object has a volume setting, a channel list, a channel setting, and so on. We'll make calls to a number of different methods of the different objects. At the end, we'll call the `showInfo()` method on each `TV` object to see the resulting settings.

File: OO_TV_TwoInstances.py

```
# Two TV objects with calls to their methods
class TV():
    --- snipped code of TV class, as in Listing 2-7 ---
# Main code
oTV1 = TV() # create one TV object
oTV2 = TV() # create another TV object

# Turn both TVs on
oTV1.power()
oTV2.power()

# Raise the volume of TV1
oTV1.volumeUp()
oTV1.volumeUp()

# Raise the volume of TV2
oTV2.volumeUp()
oTV2.volumeUp()
oTV2.volumeUp()
oTV2.volumeUp()
oTV2.volumeUp()

# Change TV2's channel, then mute it
oTV2.setChannel(44)
oTV2.mute()

# Now display both TVs
```
